

DBSCAN: A Density-Based Spatial Clustering Algorithm

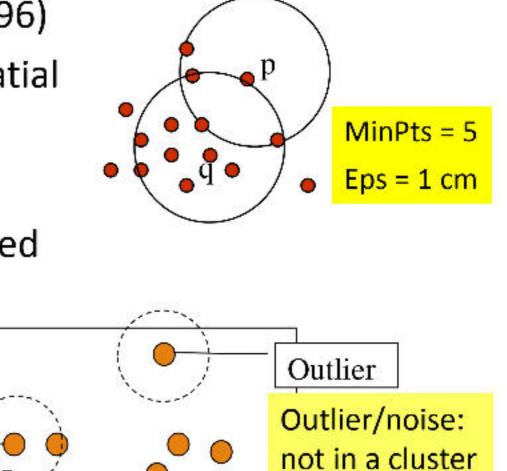

Border

Core

- □ DBSCAN (M. Ester, H.-P. Kriegel, J. Sander, and X. Xu, KDD'96)
 - Discovers clusters of arbitrary shape: <u>Density-Based Spatial</u>
 <u>Clustering of Applications with Noise</u>
- A density-based notion of cluster
 - A cluster is defined as a maximal set of density-connected points

- \square Eps (ε): Maximum radius of the neighborhood
- MinPts: Minimum number of points in the Eps-neighborhood of a point
- \square The Eps(ε)-neighborhood of a point q:
 - N_{Eps}(q): {p belongs to D | dist(p, q) ≤ Eps}

Core point: dense

neighborhood

Border point: in cluster but

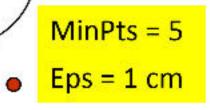

neighborhood is not dense

DBSCAN: Density-Reachable and Density-Connected

Directly density-reachable:

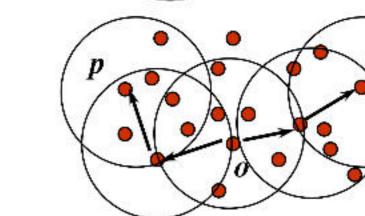

- A point p is directly density-reachable from a point q w.r.t. Eps (ε) , MinPts if
 - \square p belongs to $N_{Eps}(q)$

□ core point condition: $|N_{Eps}(q)| \ge MinPts$ Proposity-reachable:

A point p is density-reachable from a point q w.r.t. Eps, MinPts if there is a chain of points $p_1, ..., p_n, p_1 = q, p_n = p$ such that p_{i+1} is directly density-reachable from p_i

Density-connected:

 \square A point p is density-connected to a point q w.r.t. Eps, MinPts if there is a point o such that both p and q are density-reachable from ow.r.t. Eps and MinPts

DBSCAN: The Algorithm

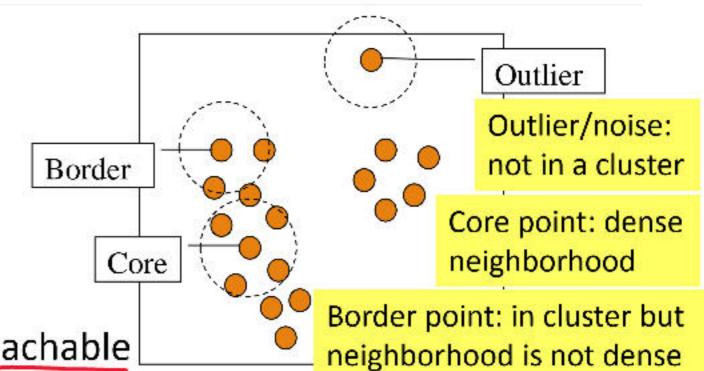

Algorithm

- Arbitrarily select a point p
- Retrieve all points density-reachable from p w.r.t. Eps and MinPts
 - ☐ If *p* is a core point, a cluster is formed

Continue the process until all of the points have been processed

Computational complexity

- If a spatial index is used, the computational complexity of DBSCAN is O(nlogn), where n is the number of database objects
- Otherwise, the complexity is O(n²)

4

DBSCAN Is Sensitive to the Setting of Parameters

Figure 8. DBScan results for DS1 with MinPts at 4 and Eps at (a) 0.5 and (b) 0.4.

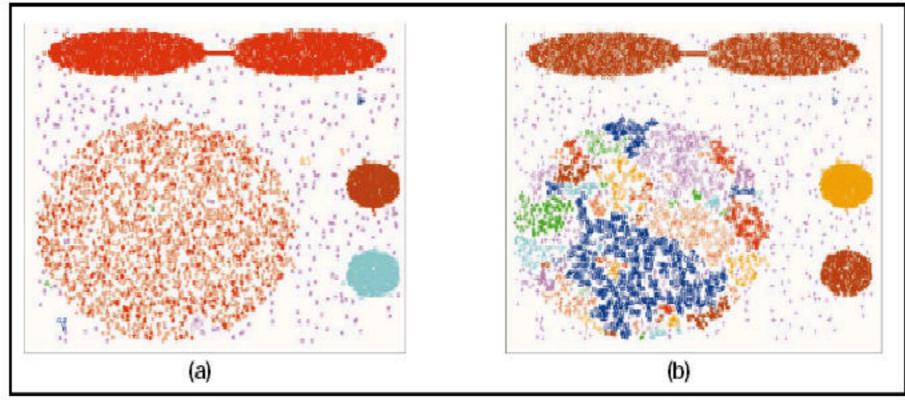

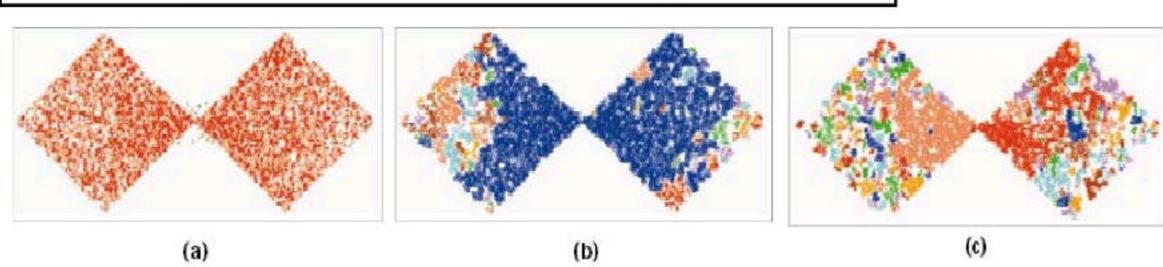

Figure 9. DBScan results for DS2 with MinPts at 4 and Eps at (a) 5.0, (b) 3.5, and (c) 3.0.
